Windows窗口程序

Windows 编程模型

一个完整的Win32程序(#include <windows.h>),该程序实现的功能是创建一个窗口,并在该窗口中响应键盘及鼠标消息,程序的实现步骤为:

- WinMain函数的定义
- 创建一个窗口
- 进行消息循环
- 编写窗口过程函数

窗口程序模板代码

```
#include <Windows.h>
1
2
  // 自定义窗口过程回调函数
3
  LRESULT CALLBACK MyWindowProc(HWND hwnd, UINT Msg, WPARAM wParam, LPARAM
4
   1Param) {
5
6
      switch (Msg) {
      case WM_DESTROY:
7
8
          PostQuitMessage(0);
                                                    网址:https://noi.hioier.co
```

```
9
            return 0;
10
        }
11
12
        return DefWindowProcA(hwnd, Msg, wParam, 1Param);
    }
13
14
15
    int WINAPI WinMain(HINSTANCE hInstance, HINSTANCE hPrevInstance, LPSTR
    lpCmdLine, int nShowCmd) {
16
17
        // 注册窗口类
18
        WNDCLASS wnd;
19
20
        wnd.cbClsExtra = 0;
21
        wnd.cbWndExtra = 0;
22
23
        wnd.hbrBackground = (HBRUSH)(GetStockObject(WHITE_BRUSH));
24
        wnd.hCursor = LoadIcon(NULL, IDC_ARROW);
25
        wnd.hicon = Loadicon(NULL, IDI_APPLICATION);
26
        wnd.lpfnWndProc = MyWindowProc;
27
        wnd.lpszClassName = TEXT("blackcat");
        wnd.lpszMenuName = NULL;
28
29
        wnd.style = CS_HREDRAW;
30
        wnd.hInstance = hInstance;
31
32
        RegisterClassA(&wnd);
33
34
        // 创建窗口 返回之前发送 VW_CREATE
35
        HWND hwnd = CreateWindowA(
            TEXT("blackcat"),
36
37
            TEXT("黑猫编程"),
38
            WS_OVERLAPPEDWINDOW,
            100, 100, 300, 300, NULL, NULL, hInstance, NULL
39
40
        );
41
42
        // 显示窗口
43
        ShowWindow(hwnd, nShowCmd);
44
45
        // 更新窗口
46
        UpdateWindow(hwnd);
47
48
        // 消息循环 收到 VM_QUIT 退出
49
        MSG msg;
50
        while (GetMessageA(&msg, hwnd, 0, 0)) {
51
            TranslateMessage(&msg);
52
            DispatchMessageA(&msg);
53
        }
54
55
        return 0;
    }
56
```
